Launch & Go-to-Market Strategy

6.1 Phased Launch Architecture

From Infrastructure Activation to Token Liquidity Onboarding

AGV Protocol's launch architecture integrates real asset readiness, community activation, and controlled market entry, ensuring the token economy is not narrative-first, but infrastructure-synchronized. This phased architecture is engineered to support token price stability, user demand buildup, and exchange-grade compliance.

Launch Timeline (Infra + Token Co-Live)

Phase	Trigger Event	Key Deliverables
Testnet Live	Internal Testnet + DAO Dashboard Alpha	Governance simulation, data verification, test users rewarded via task NFTs
NFT Launch	1st Orchard & PV Units Online (Confirmed Yield)	Stake-to-Adopt live, NFT whitelisting opens, Tree #001–#500 adoption event
Token IDO	>1,000 NFTs Adopted + rGGP Burn Trigger >20%	Public token sale (whitelisted), GVT/rGGP price discovery, DEX + LP pools initiated
CEX Listing	Oracle Dashboard online + DAO TVL >$2M + IRR proofs >15%	Launch on Tier-1 CEX (Gate/Bitget), MM strategy begins, real asset reports disclosed

The Token IDO and initial exchange listing are targeted for the mid-Q3 2025 window (around September), subject to milestone-based triggers including asset deployment, DAO treasury activation, and rGGP burn thresholds.

Smart Sequencing Principles

1. Asset-First, Token-Second

No token enters circulation before verified infrastructure is online and productive. This prevents vaporware speculation and anchors price to yield.

2. KPI-Gated Triggers

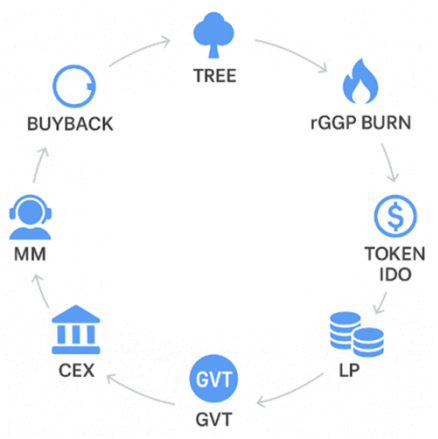
All launch steps are conditional—not scheduled. Examples:

- NFT staking only starts after Tree Sensors go online
- IDO unlocks only after rGGP burn & adoption > defined thresholds
- CEX launch gated by verified DAO revenue + on-chain proofs

3. Staged Liquidity Deployment

- Phase 1: LP rewards = 2M GVT/month for 12 months
- Phase 2: MM reserve unlocks based on KPIs (volume, TVL)
- Phase 3: DAO Treasury takes over via bonding + buyback logic

4. Onboarding Feedback Loop



Each successful phase unlocks the next:

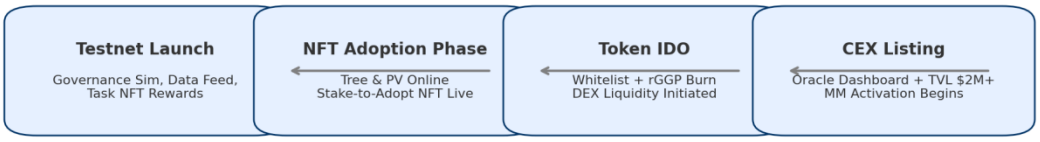
Tree→NFT→rGGP burn→IDO→GVT→LP→CEX→MM→Buyback→New Trees

Proof-of-Execution Anchors

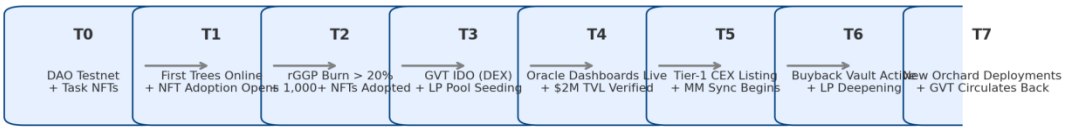
Proof Layer	Source
Real-Asset Readiness	Yichuan Project Reports + IoT Sensor Data
Stakeholder Verification	DAO NFT Registry + Adoption Dashboard
Token Metrics	rGGP burn % + LP lockup data
Compliance & Audit	CertiK + Howey/MiCA/FATF docs (Sec. 5.9)

Price Control Mechanism: Not Dumpable

- No pre-mint, no VC cliff unlocks at IDO
- LP rewards are scheduled and capped
- Buyback Vault live from Day 1 with auto-trigger if TWAP dips
- MM clawback enforced via DAO KPIs (see Section 5.7)



Liquidity Onboarding Timeline: Infrastructure to Exchange



6.2 Gamified Adoption & Whitelist Incentives

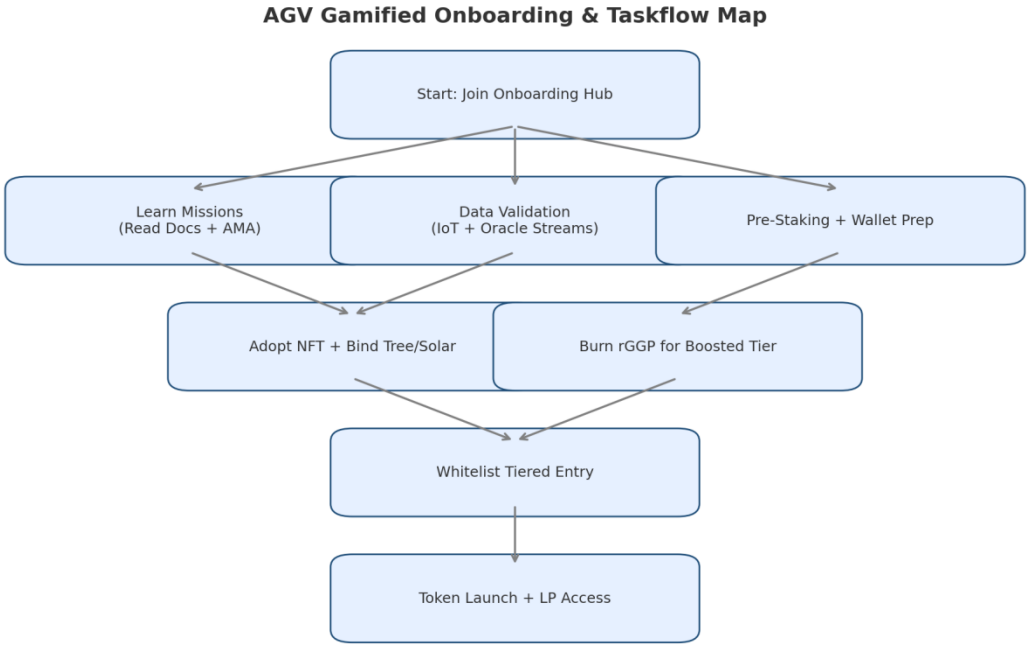
Task-Based Engagement, NFT Adoption Quests, and Tiered Onboarding

AGV Protocol transforms traditional whitelist campaigns into an infrastructure-linked adoption journey, where community members earn access to token launch through meaningful engagement with real assets. This creates proof-of-interest, incentivized education, and early user alignment with long-term yield infrastructure.

Onboarding Missions: Learn-to-Earn Meets Adopt-to-Mint

Track	User Action	Reward
Education Quests	Read documents, pass quizzes, attend AMAs	XP Points → Whitelist Tier Up
Infra Watch	Subscribe to IoT dashboards, validate field data	Verified Explorer Badge → Boosted NFT Drop
Adoption Prep	Pre-stake GVT or complete wallet missions	Guaranteed Tree/Solar NFT Access
Social Referral	Invite 3+ users to complete onboarding	rGGP Bonus + DAO Governance Snapshot

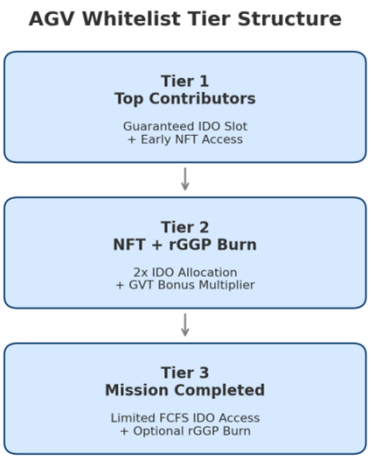
All quests are completed on-chain or via zk-linked dashboard, with full transparency and bot-proofing measures in place.



Whitelist Structure: Tiered, Transparent, and Burn-Enabled

The whitelist is not lottery-based, but tiered by contribution and verifiable participation:

Tier	Criteria	Benefit
Tier 1	Top 100 XP scorers / DAO contributors	Guaranteed IDO Slot + Early NFT Rounds
Tier 2	Adopted NFT + rGGP Burn > Threshold	2x IDO Allocation, GVT Bonus Multiplier
Tier 3	Completed Minimum Missions	Limited IDO Access (FCFS), rGGP optional burn



Note: rGGP can be burned to permanently unlock higher tiers — reinforcing its economic sink and governance power.

Mechanism Integration: Not Just Tasks, But Ecosystem Entry

These adoption missions are designed as entry points into the AGV economy, not short-term giveaways. Participants gain:

- Stake-to-Adopt priority access
- DAO reputation building
- Long-term farming eligibility
- Identity credentials tied to on-chain XP (for zk reputation & scoring)

Compatibility & Scaling

- Fully compatible with Galxe, Zealy, Layer3 & QuestN frameworks
- Supports soulbound NFT badges & verifiable taskproofs
- Designed for eventual modular automation (zkBadge + DAO Snapshot + LP airdrop sync)

6.3 Liquidity Architecture & Market Making Strategy

LP Seeding, MM Allocation, Treasury Support & Volatility Buffering

AGV's liquidity provisioning strategy leverages a tiered structure drawn from the allocated 10% Market Making & Liquidity Pool, designed to provide depth, mitigate volatility, and maintain decentralized control across DEX and CEX environments.

1. Layered Liquidity Structure

AGV deploys a three-layered liquidity stack to prevent short-term slippage while maintaining DAO-level flexibility:

Liquidity Layer	Volume Allocation (% of 10%)	Initial LPs on Uniswap, Raydium, PancakeSwap
DEX Seeding Pool	50%	Initial LPs on Uniswap, Raydium, PancakeSwap
CEX MM Partnership Pool	25%	Token injection into MM-managed order books (e.g. Gate, Bitget)
DAO-controlled Buffer	25%	On-chain reserve for price defense, emergency buyback, or LP rebalancing

All liquidity flows are sourced from the 10% Liquidity Allocation in the Token Distribution Plan. DAO multisig control ensures transparency and adjustable deployment via governance proposals.

2. LP Mining + MM Incentives

To bootstrap market depth across chains and venues:

- LP Mining: GVT yield farming with halving schedule

Year 1: 2M GVT/month → Year 2: 1M → Year 3: 0.5M

- CEX MM Program: Liquidity-backed incentive with clawback clause based on:

30-day volume target

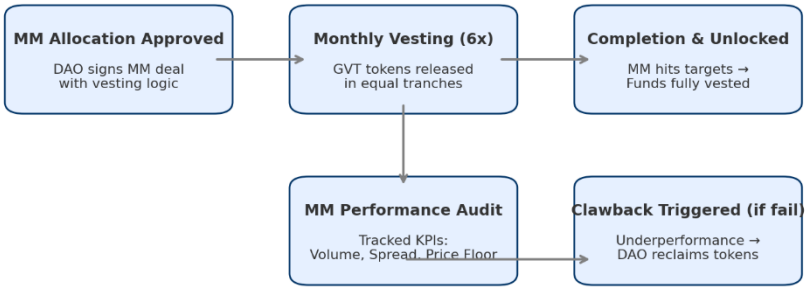
90-day floor price maintenance

- Vesting Controls:

MM tokens unlocked monthly over 6 months

DAO vote can revoke underperformance.

Market Maker Vesting & Clawback Control Flow



3. Dynamic

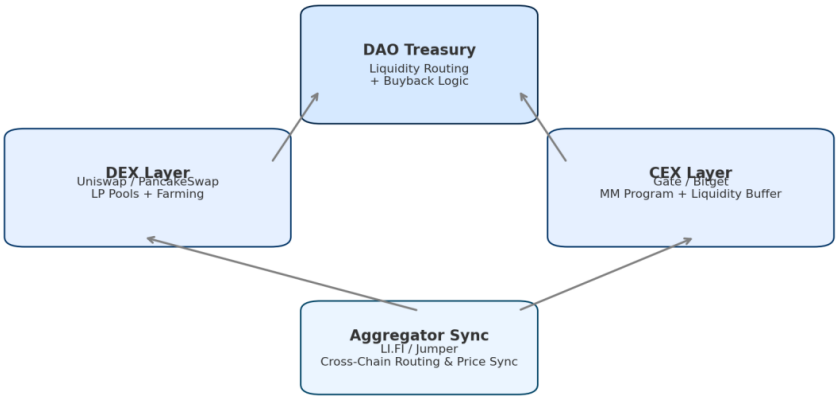
Buyback & Reallocation Vault

AGV protocol enables real-time treasury action based on token velocity and liquidity ratio:

- Buyback vault auto-triggers below TWAP deviation threshold
- Unused LP or MM reserves can be re-routed to bonding or NFT rewards
- DAO governance can rotate funds across chains and venues (e.g., from ETH → Solana → BNB)

4. Multi-Chain Liquidity Synchronization

AGV leverages cross-chain DEX aggregators (e.g., LI.FI, Jumper) to:



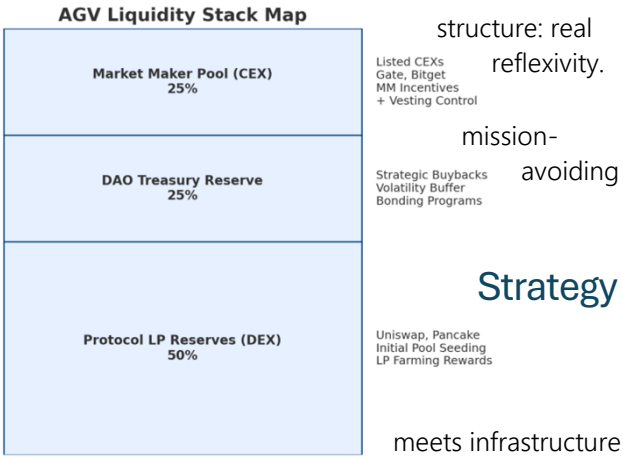
- Ensure consistent price and depth on BSC, Solana, ETH,
- Enable LP arbitrage routing reduction via incentives
- Prevent fragmented liquidity trap by mirroring pools across chains

5. Price Defense & Market Confidence

Mechanism	Effect
Halved LP Rewards	Reduces inflation and selling pressure
MM Performance Bond	Protects listing price from downward manipulation
TWAP-Based Buybacks	Builds predictable price defense layers
Bonding Vault Lockups	Absorbs excess sell-side pressure into protocol

Combined, this enables a non-pump-n-dump structure: real yield > token utility > liquidity stability > price reflexivity.

AGV's liquidity system is auditable, modular, and mission-aligned, designed for scaling to $50M+ TVL while avoiding speculative traps



6.4 Regional Ecosystem Growth Strategy

Real Assets, Real Users, Real Market Entry

AGV is designed to operate where user demand meets infrastructure

readiness. Unlike meme-centric projects, AGV scales through region-specific narratives backed by physical productivity, community adoption, and policy alignment.

Priority Markets: Not by Speculation, But by RWA Relevance

Region/Country	User Interest & Capital Drivers	Entry Model (Token + Asset)
Indonesia	Top RWA interest globally (10%+ search traffic, rising crypto base)	Fruit Tree adoption via ID-stablecoin vaults + NFT DAO
Türkiye	Strong inflation hedge demand, young DeFi-native user base	Burn rGGP → Tree NFTs → CEX quota → GVT farming
United States	#1 in global RWA crypto search share (~14.8%)	View-only access to DAO dashboard, no GVT sale inside US【1】
Vietnam/Philippines	Large L2 user populations, Layer3 + Galxe active zones	Gamified onboarding missions, language-local NFT adoption
Singapore	High Web3 legal clarity, MAS framework, ESG capital gateway	Carbon vault pilot zone + MAS-compatible DAO experiments
Europe (France/UK)	MiCA rollout in 2025, ESG and RWA bond-friendly landscape	Tokenized orchard data → green bond experiments on-chain

Regional Go-To-Market Models

Model Type	Applied Region	Description
NFT Adoption Layer	SEA / MENA / India	Region-specific tree/solar NFTs with localized UI/UX
Task-Based Whitelisting	Philippines / Vietnam / LATAM	Galxe / Layer3 campaigns for rGGP airdrops and IDO slots
SPV Co-investment Pools	Middle East / Singapore	DAO tranches accessible to regulated family offices / funds
Carbon DAO Vaults	Europe / Singapore	Tokenized yield from solar/agri → ESG-compliant green vaults

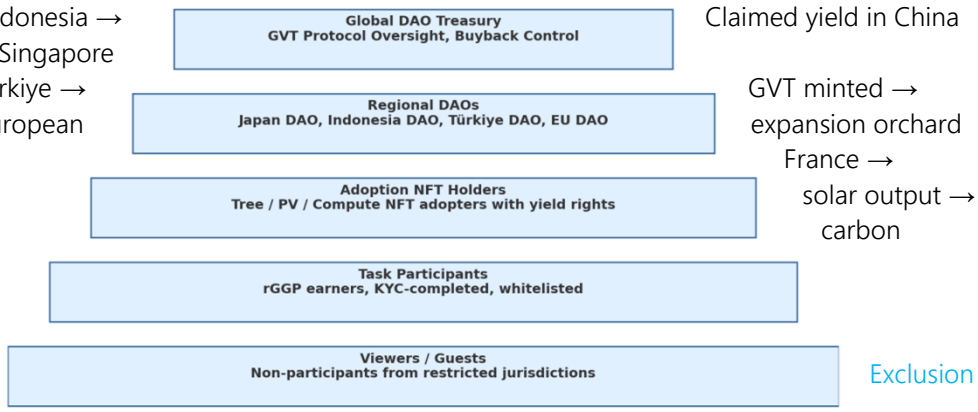
Region-Specific Product Modularity

Component	Function in Local Markets
Geo-tagged NFTs	Claim rights to physical yield (fruit, solar, compute)
Regional DAO Governance	Localized whitelist, validator control, grant layers
Local Stablecoin Vaults	Support TRY, IDR, PHP, SGD, EUR for yield anchoring

Cross-Chain Claim Routing Users adopt tree in Region A, claim yield in Region B

Interoperable Ecosystem

- Tree Adopted in Indonesia → → DAO staking in Singapore
- rGGP Burned in Türkiye → used to vote for European
- ESG DAO Vault in backed by Shaanxi re-invested in compute farm



Regulatory Positioning (US Logic)

AGV Protocol does not sell GVT tokens or conduct promotional campaigns inside the United States. In accordance with:

- U.S. SEC's Howey Test Guidance
- FinCEN and CFTC token sales frameworks
- AGV tokens offer no equity, no profit right, no centralized managerial dependency

U.S. users are geo-fenced from token purchases and receive only view-only dashboards.

Tokens are issued solely as a utility vehicle linked to verified infrastructure output, not for speculation or investment returns.

Note on Restricted Jurisdictions

AGV is not available in jurisdictions that prohibit or restrict utility token usage, including Mainland China, USA, Canada, Iran, North Korea, etc. Regional SPV wrappers may be used for infrastructure investment, while tokens remain strictly non-security instruments under global FATF/MiCA/FSA guidelines.

This regional strategy balances regulatory defensibility, infrastructure alignment, and real-world user behavior, allowing AGV to scale across five continents without compromising legal clarity or user safety.
